

# Rocky Mountain Area

## Fire Potential

### 30-45Day Fire Potential Outlook

### Fire Potential Outlook:

Remains Above Average through at least Mid April

Active weather pattern will provide some opportunities for precipitation east of the divide during the next 30 days

Frequency of pre-frontal conditions typically increase during the spring, which may result in several more periods of increased large fire risk.

Extent of green-up is unknown and will be dependent on precipitation amounts and duration

Wildcard: Ignition?

Summer fire season will be dependent on precipitation for the remainder of the spring and timing of green-up.
