| SO | Description |
|---|---|
| **WUI** | **Natural ignitions within this SO will generally not be considered for long duration management although wildland fires managed for resource objectives is authorized Forest-wide.**<br>• The first priority for fire management in this SO is the safety of personnel and the public, including adjacent landowners.<br>• WFDSS documentation will address management actions to minimize impacts to protection areas. The analysis should justify the rationale (such as a more defensible boundary) for this decision.<br>• Suppression strategies should factor in jurisdictional boundaries. |
| **General Forest** | **Wildland fire managed for resource objectives is authorized Forest-wide, consistent with Forest-wide and DFC emphasis and direction.**<br>• Natural fires play as nearly as possible their role as a process of ecological change.<br>• The number, size, and intensity of fires approximate a natural fire regime.<br>• Develop the appropriate wildland fire management response in acost effective manner appropriate with the resource values at risk.<br>• Suppression strategies should factor in jurisdictional boundaries. |
| **Wilderness** | **Fire management emphasizes the preservation of Wilderness values and allows natural processes of ecological change to operate freely with minimal management interaction subject to risk management principles**<br>• The number, size, and intensity of fires approximate the natural fire regime.<br>• MIST fire suppression guidelines are used to reduce resource damage.<br>• Suppression strategies should factor in jurisdictional boundaries and WUI management Requirements. |

Teton Interagency FIRE
