

Pacific Northwest 7 Day Significant Fire Potential

Tuesday, June 27, 2017

Legend

Fire Environment (FEN) 4 levels

Minimal	- The Overall Fire Environment suggests a very low risk for Large fires (less than 1% chance)
Normal	- The Overall Fire Environment suggests a normal risk for large fires (1 - 4% chance)
Elevated	- The Overall Fire Environment suggests a moderately high risk for large fires (5 - 19% chance)
High Risk	The risk for large fire(s) is very high (≥ 20%) Triggers: 1. ⚡ (Significant Lightning) 2. BEN (Critical Burn Environment)

The assessment of the overall fire environment considers multiple factors including weather, lightning amount and fuel dryness. Large Fire probabilities are derived objectively via statistical methods. **High Risk** levels (≥ 20% probability of a large fire) are almost always due to significant lightning as burning conditions alone rarely result in a large fire probability much above about 10%.

NW11								
NW12								

Fire Potential: Large fire risk is diminishing due to a brief plateau in fire danger and the end of the recent lightning outbreak. The atmosphere is cooling and stabilizing for the next several days so initial attack activity will be on a downward trend for most areas. Wind prone regions of the Columbia and Deschutes Basins (PSAs NW05, NW06, and NW10) will continue to be at elevated risk of fast moving fires in fine fuels this week.

For weather details in your area see your local NWS fire weather planning forecast.

Please call NWCC Predictive Services (503) 808-2737 with any questions.

Preparedness Level:

Northwest: 2
National: 2
