Legend

Fire Environment (FEN) 4 levels

- Minimal** - The Overall Fire Environment suggests a very low risk for Large fires (**less than 1% chance**)
- Normal** - The Overall Fire Environment suggests a **normal** risk for large fires (**1 - 4% chance**)
- Elevated** - The Overall Fire Environment suggests a moderately high risk for large fires (**5 - 19% chance**)
- High Risk** - The risk for large fire(s) is very high (**≥ 20%**)
Triggers: 1. ⚡ (Significant Lightning)
2. BEN (Critical Burn Environment)

The assessment of the overall fire environment considers multiple factors including weather, lightning amount and fuel dryness. Large Fire probabilities are derived objectively via statistical methods. **High Risk** levels (≥ 20% probability of a large fire) are almost always due to significant lightning as burning conditions alone rarely result in a large fire probability much above about 10%.

Fire Weather: Any residual showers will taper off this morning as a ridge of high pressure builds over the Pacific Northwest, ushering in dry and calm weather that should last at least into the middle of next week. Temperatures are expected to stay close to seasonal normal through the next week. The moist ground and stable airmass will bring overnight/morning fog for many areas over the next few days.

See your NWS forecasts for the latest details in your area.

Fire Potential: The potential for new significant fires remains very low across the geographic area. Drier weather could offer opportunities for project work where air stagnation is not a concern.

Preparedness Level:

Northwest: 1
National: 1
