

FLORIDA ANNUAL OPERATING PLAN FOR FIRE WEATHER

2023 Updates to Operating Plan for Fire Weather Services in Florida

A. Boothe (NWS Jacksonville)

- *p. 15* – Description and quantification of “Wetting Rain”
- *p. 16* – Explain the possibility of FWF updates between routine issuances
- *p. 20* – LVORI Table Updates
- *p. 30-31* – “Red Flag Warnings” and “Fire Weather Watches” fuel criteria now use the 7-day Significant Fire Potential rating provided by the Southern Area GACC.
- *p. 36* – IMET Interagency Agreement linked
- *p. 38* – Services now include revamped NWS-Chat 2.0 (SLACK); registration link
- *p. 44* – RAWs table and Mesowest links updated

I. Introduction and General Program Information

Despite ongoing land development, Florida continues to have expansive areas of forests and undeveloped land. Preserves, parks, refuges and other publicly and privately owned lands are found throughout the state from the panhandle to the Florida Keys. Proper management of this land and its resources is vital to the economy of the state and the preservation of the health and ecological balance of the environment.

Land management agencies are concerned with the control of wildfire, as well as the use of fire as a management tool to protect life, property and economic interests. Critical to this mission is access to timely and accurate weather forecast information which is used in decision making for wildfire prevention, fire control, prescribed burning, and smoke management.

The Florida Annual Operating Plan will be the governing document for fire weather procedures and cooperation among the following agencies:

National Weather Service (NWS)	U.S. Forest Service
U.S. Fish and Wildlife Service	National Park Service
Department of Defense	Florida Forest Service
Florida Park Service	U.S. Department of Agriculture
Bureau of Indian Affairs	

This Operating Plan conforms to the Interagency Agreement for Meteorological Services, last reviewed in 2022. Link to national agreement:

https://www.weather.gov/media/fire/2022_2027_USFS_SOW_IMET_agreement.pdf

The Florida Annual Operating Plan will be reviewed annually and revised as needed. The annual review and revision (if needed) may be rotated among the Florida NWS offices. The plan will be reviewed annually by the land management agencies, NWS regional and national headquarters, and NWS Florida offices.

The National Weather Service Fire Weather Program ([Ref NWS Directive 10-4](#))

The objective of the National Weather Service fire weather services program is to provide fire weather products and services to the fire and land management community for the

protection of life and property, promotion of firefighter safety, resource allocation, and stewardship of America's public lands.

II. Service Area and Organizational Directory

Forecast Areas

Fire weather forecasts are provided for the state of Florida through the year from seven National Weather Service offices. These offices are located at Miami, Key West, Melbourne, Ruskin (Tampa Bay), Jacksonville, Tallahassee, and Mobile, Alabama. NWS forecast offices at Jacksonville, Tallahassee, and Mobile also have additional forecast areas of responsibility for areas bordering Florida into Georgia, Alabama, and Mississippi.

Fire weather forecast products are divided into zones. Some counties have two or more forecast zones to better define forecast differences.

Site specific forecasts are provided daily for at least one location in each of Florida's 67 counties. These forecasts are a component of the National Fire Danger Rating System (NFDRS) to compute fuel moisture and burning indices and to assess wildland fire danger.

Under the supervision of the Meteorologist-In-Charge (MIC) at National Weather Service (NWS) offices, forecasters are provided training in fire weather meteorology. Forecast support is provided 24 hours per day, year-round. At least one meteorologist at each National Weather Service office is designated as the Fire Weather Program Leader and serves as the interagency liaison. The Fire Weather Program Leader serves as the NWS contact for land management agencies within each National Weather Service forecast office area of responsibility.

MICs should ensure an updated list of fire weather customers and users are included in the WFO station duty manual or other appropriate reference. Fire Weather Program Leaders and other designated NWS team members should lead fire weather outreach and coordination efforts within their area of forecast responsibility. The NWS Fire Weather Program Leader at each office must maintain regular contact with fire and land management agencies and help them assess meteorological needs. Fire Weather Program Leaders will inform fire weather customers of available NWS products and services. Fire and land management personnel are encouraged to visit their local NWS Forecast Offices to become familiar with NWS personnel, operations and services. Similarly, NWS forecast staff are encouraged to visit land management agencies and operational sites (including observing prescribed burns and visiting Remote Automated Weather Station (RAWS)).

III. National Weather Service Products & Services

Florida Seasonal Fire Weather Concerns

The primary fire weather season for Florida prevails January through May when fuel moistures are lowest, frosts kill herbaceous fuels, and gusty winds with lower relative humidity often occur. However, critical fire conditions can occur throughout the year, most notably during periods of drought.

Lightning in the spring is a wildfire ignition threat when fuels are dry and soil moisture is low. Seasonally high dispersion values occur on many spring afternoons due to higher sun angles (longer afternoons) and breezy wind across dry fuels. Wildfire threat diminishes during Summer through early autumn as fuels tend to moisture and become less receptive to ignition. During periods of drought, forecasts may predict a “wetting rain” event, which is dictated by forecast rainfall amounts of 0.25” or more.

National Weather Service Fire Weather Forecast Products

The objective of the National Weather Service fire weather services program is to provide fire weather products and services to the fire and land management community for the protection of life and property, promotion of firefighter safety, and stewardship of America’s public wildlands.

Each Florida National Weather Service forecast office issues fire weather products for their fire weather service area, including the following (Reference [NWSI 10-401](#)):

- A. Fire Weather Planning Forecast (FWF)**
- B. National Fire Danger Rating System (NFDRS) Forecast (FWM)**
- C. Spot Forecast (FWS)**
- D. Fire Weather Watch and/or Red Flag Warnings (RFW)**

A. Fire Weather Planning Forecast (FWF)

The National Weather Service Fire Weather Forecasts are a zone-type product providing meteorological information used by land management personnel primarily for input in decision-making related to managing resources, pre-suppression operations, smoke management and other planning. The decisions impact firefighter safety, protection of the public and property, and resource allocation.

The Fire Weather Planning Forecast provides an average of expected 36 to 48 hour weather conditions across a given zone. Zones are typically a county, or a section of a county. During daylight hours, forecasted elements should reflect conditions expected for periods of highest fire ignition potential, typically during the mid to late afternoon hours.

Fire Weather Planning Forecast Issuance

The Fire Weather Planning Forecast is issued year-round, at least twice a day. The product breaks down average forecast elements for a particular zone that includes a headline, weather synopsis, and five to seven day extended forecast outlook. The early morning Fire Weather Forecast (FWF) is the 36 hour (today/tonight/tomorrow) planning forecast. Scheduled issuance is no later than 0730 am Eastern time (0630 am Central). The mid-afternoon Fire Weather Forecast is 48 hours (tonight/tomorrow/tomorrow night/following day). Scheduled issuance is no later than 1545 pm Eastern time (1445 pm Central). If significant forecast adjustments are required or a short-fused Red Flag Warning(s) is (are) issued, updates to the Fire Weather Planning forecast will occur between scheduled issuances.

The morning forecast is for three 12-hour periods (today, tonight, and tomorrow), beginning at 6 am local time on the day of forecast preparation. The afternoon forecast is for four 12-hour periods (tonight, tomorrow, tomorrow night, and the following day), beginning at 6 pm local time on the day of forecast preparation. Periods are defined as:

Today	6 am to 6 pm	Tonight	6 pm to 6 am
Tomorrow	6 am to 6 pm	Tomorrow Night	6 pm to 6 am
Day After Tomorrow:	6 am to 6 pm		

The 20 ft Wind variable is displayed in 6 hr periods denoted as “AM” or “PM”. An “AM” and “PM” period row is shown and follows the time periods denoted in the below. Note, these periods change with Daylight Savings.

During Eastern Standard Time:

“AM” Daytime	7 am to 1 pm	“PM” Daytime	1 pm to 7 pm
“PM” Nighttime	7 pm to 1 am	“AM” Nighttime	1 am to 7 am

During Eastern Daylight-Savings Time:

“AM” Daytime	8 am to 2 pm	“PM” Daytime	2 pm to 8 pm
“PM” Nighttime	8 pm to 2 am	“AM” Nighttime	2 am to 8 am

Fire Weather Planning Forecast Content

Headline: An overview headline, before the weather discussion, is required when red flag warnings and/or fire weather watches are in effect. The headline(s) will include the warning type, location, brief reason for issuance, and effective time period. A blank line will separate headlines from the weather discussion. Headlines will be included above in each appropriate zone grouping, if needed. A headline will also be included when the maximum dispersion (LDSI) is greater than 75 for areas away from the coast, or the maximum is less than 20 during the day. At night, a headline will be included if the Minimum dispersion is greater than 10.

Weather discussion: This discussion is a brief, plain language narrative of the weather pattern as it pertains to the forecast zones in the product with emphasis on the first period forecast through 48 hours. Weather elements which cannot be adequately addressed in the tabular format can be discussed within the synopsis. Such elements may include the passage of cold fronts, tropical disturbances, the onset of sea breezes, likelihood for freezes or frosts, and thunderstorm wind gusts, etc. This will include dispersion when the dispersion index is 75 or higher or when daytime dispersion is 20 units or lower. It will also include a statement regarding the expectation of fog formation over the next 48 hours.

Zone Forecast Tabular Content: Forecast zone numbers will be followed by a county name that corresponds to that particular zone number. Below, a tabular forecast with average weather parameters across the entire zone will appear for each 12-hr time block. Forecast parameters and details are below.

Extended forecast: A forecast for general weather conditions for days 5 or up to 7 days will be appended to each zone grouping...with wind forecast for each day.

Fire Weather Planning Forecast Tabular Content and Decode:

Forecast weather parameters will be defined by element wording down the left margin of each zone grouping with the descriptor that best describes the 12-hour forecast period across the zone. Weather parameters are defined as follows:

1. **Cloud cover** (descriptions may be abbreviated): Clear, mostly clear, partly cloudy, mostly cloudy, cloudy
2. **Precip (Weather) type** (descriptions may be abbreviated): None, freezing rain, fog, drizzle, rain, snow/rain showers, snow, thunderstorms.

Definitions of weather type:

- a. Fog: Large mass of water vapor condensed to fine particles, at or near the ground, obscuring visibility.
 - b. Drizzle: Mist, very small water droplets that appear to float when falling.
 - c. Rain: Steadily falling small to medium sized water droplets.
 - d. Shower: Medium to large water drops that begin or end abruptly. No thunder.
 - e. Thunderstorm: Heavy or violent downpour of large water drops accompanied with lightning and most often with gusty winds or possibly hail.
 - f. Freezing rain: Liquid precipitation that freezes upon contact with ground surfaces or vegetation.
 - g. Snow/rain: Rain changing to snow or snow changing to rain.
 - h. Snow: Flakes of frozen crystalline precipitation.
3. **Chance of precipitation:** The probability of measurable (0.01 inch or more) of water equivalent at any point in the zone that has no relationship to the amount of precipitation that could occur, during the 12-hr forecast period. During the warm season, the value can be thought of as an expected area coverage of precipitation across a zone. Chance of precipitation will range from 0-100%.

4. **Temperature (Maximum & Minimum):** The dry bulb (ambient air) temperature measured at a standard six feet above the ground in degrees Fahrenheit. Maximum temperature is defined as the highest value expected across a forecast zone, usually occurring during the mid-afternoon. Minimum temperature is defined as the “average”* lowest value expected within a forecast zone, usually occurring just prior to sunrise. Forecast temperatures can range across a given zone due to localized vegetative cover, terrain, soil type, or proximity to lakes and coastal marine areas. Users are advised to adapt forecasts to local conditions. Temperature less than zero will be preceded by a minus sign. Some offices will include a 24-hr temperature trend.

5. **Relative Humidity (Maximum & Minimum):** Relative humidity is the ratio (percent) of the amount of moisture in the air compared to the amount of moisture the air could hold at saturation for a particular temperature. Usually the lowest humidity occurs near the time of the maximum temperature, and the highest humidity occurs near the time of the minimum temperature. Humidity values run from 0 to 100 percent. Some offices will include a 24-hr relative humidity trend.

6. **Wind speed and direction (AM and PM) (20 feet) Gusts (optional):** The prevailing or average direction and speed from which the wind is blowing at the 20-foot level above the open ground or 20 feet above the vegetation surface. Wind speed is reported in miles an hour and is a one minute average. Direction will be restricted to eight compass directions. The exceptions are for variable or calm situations. Variable means a changeable wind direction occurring most often within light wind situations 3 mph or less.

7. **Precipitation:** Amounts pertain to an average precipitation expected. But for showery situations, particularly during the summer months, local amounts can vary considerably.

8. **Precipitation Duration:** Maximum duration in hours that precipitation is expected to occur within the twelve hour period. Range of values from 0 to 12 (blank indicates no precipitation):
 - 1 means one second up to one hour duration
 - 2 means two hour duration etc.

9. **Timing of Precipitation (local time):** Indicates the period of time within which precipitation is expected to begin and end. These values will be local time. Example: blank indicates no precipitation, continue, 1 am, 3 pm, etc.

10. **Lightning Activity:** Equates cloud to ground lightning to the coverage of thunderstorms within each forecast zone:

LAL Number & Term	Descriptor
1 - No Lightning	No thunderstorms forecast.
2 - Isolated Strikes	Isolated thunderstorms. Lightning infrequent to occasional. 1 to 5 cloud to ground strikes within 5 minutes.
3 to 4 - Scattered	Scattered Thunderstorms. Lightning is more frequent. 6 to 15 cloud to ground strikes within 5 minutes

5 - Numerous	Numerous Thunderstorms. Lightning is frequent. May be intense. > 15 cloud to ground strikes within 5 minutes.
6 - Dry Lightning	Not used in Florida.

11. **Mixing Height:** The height above the ground at which atmospheric stability is sufficient to inhibit vigorous vertical mixing of air (or air particulate i.e. smoke). This height can imply an inversion level. Forecast digit value is in feet above the ground. Value defines a maximum mixing height expected above the average ground surface (AGL) typically during the mid-afternoon.
12. **Transport Wind Direction and Speed:** The average wind direction and speed through the mixing layer from the surface up to the mixing height. Directions are limited to the eight compass directions with the exceptions of variable or calm conditions (generally refers to the rate at which smoke emissions will be horizontally transported from one area to another). Values are in miles an hour.
13. **Dispersion Index (DI):** An index used as a guide for atmospheric instability and smoke management.

Lavdas Dispersion Index (LDSI): Used in Florida for dispersion calculation and refers to atmospheric processes that mix and transport particulate (smoke) away from a source both horizontally via the wind and vertically via stability. The LDSI is predominantly weighted to, and directly proportional to, values of the mixing height and transport wind. LDSI incorporates factors of seasonal solar elevation angle (net radiation), total opaque cloud cover, ceiling height, and surface wind speed, with these additional elements approximating an overall atmospheric stability class.

Much of the range of good dispersion of pollutants overlaps the range of weather conditions utilized for good burning conditions, thus, with good management, neither smoke nor fire will be a hazard. High index values imply an extremely unstable atmosphere which could contribute to increased incidence of wildfire and large fire growth. Low values of the index imply poor dispersion of smoke.

A Dispersion Index of 75 or greater shall be headlined in the discussion portion of the Fire Weather Forecast (FWF). A daytime dispersion of 20 units or lower will also be headlined in the FWF.

Reference: Lavdas, Leonidas g.; *An Atmospheric Dispersion Index for Prescribed Burning*; U.S. Department of Agriculture, Forest Service, research paper SE-256, October 1986.

Daytime Dispersion Value	Florida Forest Service Descriptors
>80 units	Excellent. Control problems expected.
61-80	Very Good. Control problems likely > 75 units.
41-60	Generally Good.

21-40	Poor to Fair. Stagnation may occur if accompanied by low wind speeds.
0-20	Poor. Stagnant if persistent.

Nighttime Dispersion Value Florida Forest Service Descriptors

0-2	Poor.
3-4	Poor to fair.
5-8	Good.
9+	Very Good.

14. **The Low Visibility Occurrence Risk Index - LVORI:** This index is a measure of the risk of low visibility occurring. The risk dramatically increases when relative humidity is high and dispersion is low. This index is used to qualitatively estimate the likelihood of a vehicle accident due to poor visibility from ground smoke or fog, or a combination of both. This index can be ascertained by using the predicted nighttime DI, maximum RH, wind and the LVORI table below.

LVORI	Forestry Division of Florida’s Description of LVORI
1	Ideally low risks of accidents on highways due to smoke and/or fog formation
2-3	Relatively low risk of accidents on highways due to smoke and/or fog formation
4-6	Moderate risk of accidents on highways due to smoke and or/fog
7-10	Particularly High risk of accidents on highways due to smoke and/or fog formation

RH	Dispersion Index											
	> 40	40-31	30-26	25-17	16-13	12-11	10-9	8-7	6-5	4-3	2	1
<55	1	1	2	2	2	2	2	2	2	2	2	2

15. **Remarks:** Include appropriate remarks that add value, mark significant or pertinent weather changes, or other information. Insert 'none' if none.

This area Intentionally Blank

Example: Morning Fire Weather Planning Forecast (FWF) *truncated*

Fire Weather Planning Forecast for East Central Florida
National Weather Service Melbourne FL
350 AM EST Tue Nov 7 2023

.Discussion...

High pressure across the region through mid-week will move gradually eastward and into the western Atlantic Ocean through late week. Surface winds will remain relatively light due to the influence of this high pressure, and will be out of the north to northeast today, veering to the east to northeast into tomorrow.

Dry airmass across the region will produce lower Min RH values in the low to mid 30s near to northwest of I-4 this afternoon, with developing onshore flow allowing RH values to rise through mid to late week. It will remain mostly dry through the rest of the work week. Dispersion will be fair to generally good today and tomorrow.

Fog potential and other remarks...Some patchy light fog will be possible, mainly across areas north of I-4 through early this morning. Patchy fog will then be possible across all of east central Florida into late tonight and early Wednesday morning. Localized visibility reductions due to smoke from new or existing fires will be possible even if fog is not forecast.

Fire Weather Planning Forecast for Northeast Florida and Southeast Georgia
National Weather Service Jacksonville FL
215 PM EST Tue Nov 7 2023

.DISCUSSION...

High pressure ridge will be over area through Tonight, as a weak cold front passes to the north. The high will become centered to the northeast Wednesday, then east Thursday. The high will move away to the east Friday, with a cold front moving southeast across area Friday night. Strong high pressure will build from the northwest following the front Friday night into Saturday. An inverted trough is expected to develop over area waters over the weekend, which will enhance the onshore flow, leading to elevated winds at the coast. The high will build further southeast into area Monday night into Tuesday.

FOG POTENTIAL AND OTHER REMARKS...Nightly fog potential this week.

B. National Fire Danger Rating System (NFDRS) Forecast (FWM)

The National Fire Danger Rating System (NFDRS) measures wildland fire danger at observation sites throughout the contiguous United States. The National Weather Service role in NFDRS is forecasting weather input which, combined with user input, allows the NFDRS software to predict the next day's fire danger indices. These indices impact agency resource management decisions, firefighter safety, and protection of the public and property.

NFDRS Forecast Content and Decode:

The National Fire Danger Ratings System (NFDRS) forecast (product id FWM) is a 7 day site specific digital forecast for numerous locations across the state (1300-1300 LST). NFDRS forecast issuance times are dependent on the arrival of the observations in the FWO product, but the FWM from all offices is typically issued by 3 PM daily. Some offices also issue a morning FWM.

Format:

FCST,081301,180418,13,0,85,27,1,1,SW,08,M,85,49,96,27,0,0,N

A, B, C, D, WX,T,RH,LAL,TL,DD,FF,F,TX,TN,RX,RN,P1,P2,WF

A. Indicates forecast is for NFDRS zone or individual station. FCST = station, ZONE = forecast zone (ex: FCST). Refers to federal observing sites: First two digits are state code (Florida 08), next two digits are USFS county ID, last two digits are site number.

B. NFDRS Station Number or Zone Number (ex: 08301)

C. Year, month, and day valid forecast time (ex: 180418)

D. Always 1300 LST

WX: State of weather 1300 tomorrow (ex: 0): State of weather - single digit, 0-9:

1 Clear (less than 1/10 cloud cover)

2 Scattered clouds (1/10 to 5/10)

3 Broken clouds (6/10 to 9/10)

4 Overcast (more than 9/10 clouds)

5 Fog

6 Drizzle

7 Rain

8 Snow or Sleet

9 Showers

10 Thunderstorm

T: Temperature 1300 tomorrow in degrees Fahrenheit (ex: 85)

RH: Relative humidity 1300 tomorrow in percent (ex: 27)

LAL: Lightning Activity Level 1400 LST to 2300 LST.
Reference LAL definitions in previous section “Fire Weather Planning Forecast”

TL: Lightning Activity Level 2300 LST to 2300 LST.

DD: Wind direction 20 ft 1300 LST tomorrow (ex: SW)

FF: Wind speed 20 ft 1300 LST tomorrow. In canopy, usually about 70% of zone forecast value (ex: 8)

F: Fuel stick (not forecast). 10-hr time lag fuel moisture. Normally coded as M (missing) since computation is made by WIMS computer for DSPW and DSPI products (ex: M)

TX: Max 24-hr temperature 1300 today to 1300 tomorrow, up to 136 ° F (ex: 85)

TN: Min 24-hr temperature 1300 today to 1300 tomorrow, down to -100 ° F (ex: 49)

RX: Max 24-hr humidity 1300 today to 1300 tomorrow (ex: 96)

RN: Min 24-hr humidity 1300 today to 1300 tomorrow (ex: 27)

P1: Precipitation duration in hours 1300 LST today through 0500 LST tomorrow. One or two digits in hours (00 to 08). Reserve for rain areal coverage of 70% or higher (ex: 0)

P2: Precipitation duration 0500 LST through 1300 LST tomorrow (ex: 0)

WF: Wet flag (Y/N). Indicates if liquid water will be on fuels at 1300 tomorrow. Reserve **y** for greater than 70% area coverage of wetting rain in amounts greater than one tenth inch, otherwise **y** resets fire danger indices to zero. (ex: N)

C. Spot Forecast (FWS)

Site specific, spot forecasts, are issued by National Weather Service offices in support of wildfire suppression and natural resource management. These forecasts help land management and fire control agencies protect life and property during wildland fires and prescribed burns. Spot forecasts are also utilized for hazardous materials incidents and other potential threats to public safety influenced by weather.

The Spot Forecast is a non-routine, user requested product that includes a site-specific forecast for an incident. The product includes a headline, weather discussion focused on the next 12-24 hours, and an incremental tabular forecast.

Requesting a NWS SPOT Forecast

The National Weather Service will provide spot forecast support and service upon request of any federal, state, tribal, or local official who represents that the spot forecast is required to support a wildfire.

The Internet based NWS Spot program is used for requesting and issuing spot forecasts and should be used when possible: www.weather.gov/spot

For non-wildfire purposes, the National Weather Service will provide spot forecast support and service under the following circumstances and conditions:

- A. Upon the request of any federal official who represents that the spot forecast is required under the terms of the Interagency Agreement for Meteorological Services.
- B. Upon request of any state, tribal, or local official who represents that the spot forecast is required to carry out their wildland fire management responsibilities in coordination with any federal land management agency participating in the Interagency Agreement for Meteorological Services.
- C. Upon request of any public official who represents that the spot forecast is essential to public safety, e.g. due to the proximity of population centers or critical infrastructure. A “public safety official” is an employee or contract agent of a government agency at any level (federal, state, local, tribal, etc.) charged with protecting the public from hazards including wildland fires and/or other hazards influenced by weather conditions such as hazardous material releases.
- D. Upon request of any public official for natural resource protection and/or in support of <https://www.dhs.gov/publication/homeland-security-presidentialdirective-5> related activities.

The spot forecast may be requested immediately or scheduled for a future date and time. If Internet access is unavailable, spot forecasts may be requested and disseminated by Email.

Spot forecasts should normally be available within 30 minutes of the requested delivery time with typically no more than a 60 minute deadline. If the request is for wildfire, the meteorologist will escalate the priority of the spot forecast. For the safety of fire crews and operations, a spot request for wildfire will be prioritized similar to the expediency of severe weather warnings.

The requesting agency can aid the forecaster by providing at a minimum the following information:

1. Nature or reason of fire (wildfire or prescribed burn)
2. Name of fire
3. Name and phone number of control agency and/or representative
4. Location of the fire (latitude/longitude)
5. Size of fire or project (acres)
6. Recent weather observation near the fire site

The submission of at least one recent accurate weather observation from near the fire site is encouraged with each spot forecast request. For prescribed burns, a planned ignition time is recommended as well. Please include additional information which would help the forecaster prioritize the request such as a threat to structures, the public, fire operations, or unusual fire behavior.

User feedback is encouraged regarding the spot forecast to the NWS forecast office that issued the product, preferably substantiated by on-site observations. If the forecast does not reasonably match observed conditions, please call the forecast office and request to discuss the situation and/or to request an updated spot forecast.

NWS Spot Forecast Content

The text Spot Forecast (FWS) product will contain the name of the incident, the issuing National Weather Service Office, the time and date of spot forecast issuance and the following:

Headline: For watch/warning criteria weather discussion.

Weather parameters: For the first 12 hours will include a 1-2 hour time incremental breakup of: sky, weather, chance of precipitation, temperature, RH, and 20 ft wind. Optional elements may be forecast such as mixing height, transport winds, and atmospheric dispersion.

Outlook Forecast: Overnight period with abbreviated weather information. Outlook for next day typically with abbreviated weather information.

Example: Spot Weather Forecast (FWS)

Service.

Please contact our office at (904) 741-4370, if you have questions
or concerns with this forecast.

...MARGINALLY HIGH DAYTIME DISPERSION VALUES THIS AFTERNOON...

.DISCUSSION...

Dry weather will continue through at least Thursday night.
Light southwesterly surface and transport winds at ignition
time will shift to westerly, with surface speeds increasing
to around 10 mph towards noon, followed by decreasing speeds
late this afternoon. Strengthening surface and transport
winds will create marginally high dispersion values during
the early to mid afternoon hours today. Minimum relative
humidity values will fall to 30-35 percent this afternoon
and again on Tuesday afternoon. Surface and transport wind
speeds will quickly diminish early this evening. Light
north-northwesterly surface and transport winds will prevail
early on Tuesday morning, followed by winds shifting to
east-northeasterly before noon, with sustained surface speeds
increasing to around 10 mph during the mid to late afternoon
hours. These increasing winds will create good dispersion
values on Tuesday afternoon.

Requesting Hysplit Model Run

Government agencies may also request a Hysplit model run for chemical release and/or smoke dispersion. To request HYSPLIT forecast model trajectories from NWS Spot forecast request web pages, the authorized user must click on the box in the spot forecast request. The HYSPLIT trajectory raw data, as well as ".gif" (image) and ".kmz" (geocoded) files, will be sent to the specified email address.

For more information concerning HYSPLIT: http://www.arl.noaa.gov/HYSPLIT_info.php

D. Fire Weather Watch and/or Red Flag Warnings (RFW)

Fire Weather Watch and Red Flag Warning products inform land management agencies of critical weather factors and fuel conditions that could support extreme fire danger and/or behavior and thus threaten life and property. These products can alert to the potential for widespread new ignitions or control problems with existing fires.

Weather and fuel definition for the issuance of a Red Flag Warning is coordinated in advance with land management agencies and users within the state of Florida.

Critically dry fuels in Florida are highly dependent on one hour fuel moisture, which is directly determined by the relative humidity; therefore, critically dry relative humidity is equivalent to critically dry fuels.

Florida is divided into two geographic areas for Red Flag criteria; North Florida and Peninsula Florida. North Florida includes all zones within the NWS Mobile, NWS Tallahassee, and NWS Jacksonville service areas. The southernmost counties within 'North Florida' include Dixie, Gilchrist, Alachua, Marion, Putnam, and Flagler. All areas south of these counties are known as Peninsula Florida.

In coordination with land management agencies including the Florida Forest Service, U.S. Fish and Wildlife, National Park Service, Bureau of Indian Affairs, and other federal, state or local government agency with fire weather concerns, Red Flag events will be defined as the following:

North Florida Red Flag Criteria:

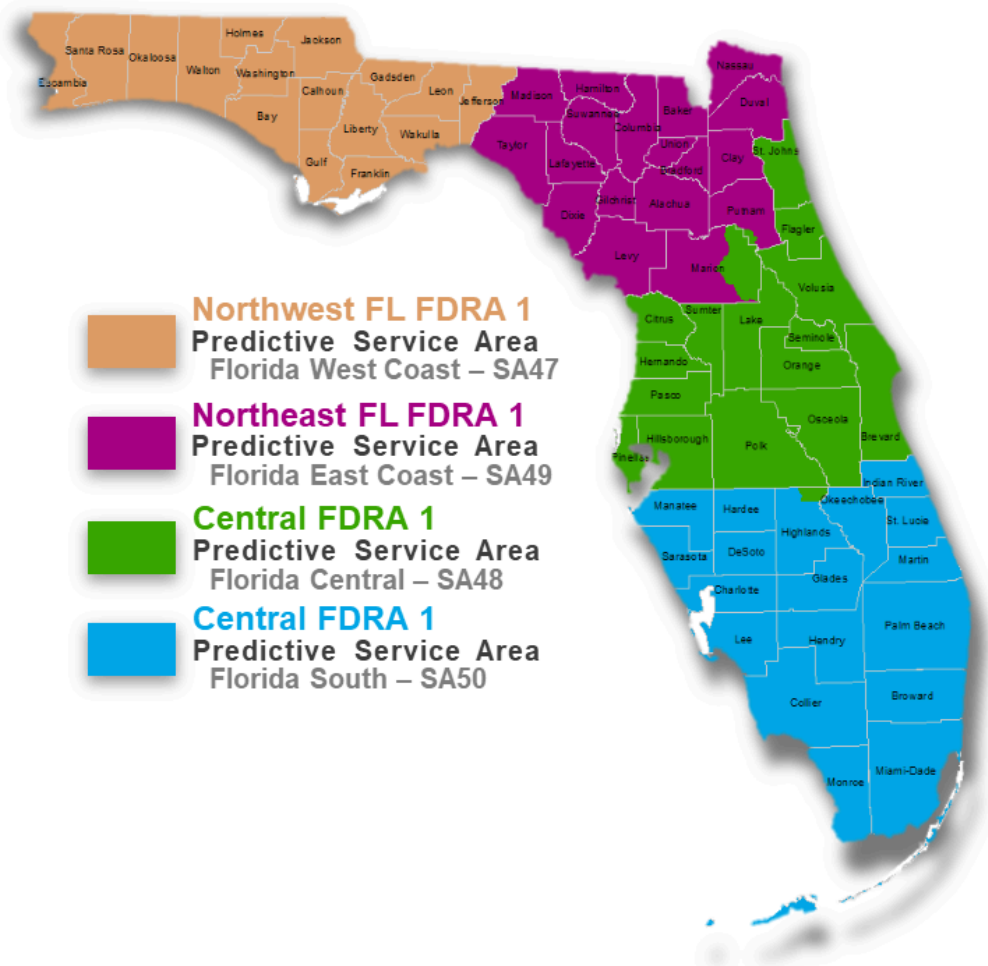

Relative humidity < 28% and sustained 20-ft winds of > 15 mph occurring with a Significant Fire Potential rating of "Moderate" or higher in the zone(s) of concern.

Peninsula Florida Flag Criteria: (Volusia, Lake, Sumter, Citrus, southward)

Relative humidity < 35% and sustained 20-ft winds of > 15 mph occurring with a Significant Fire Potential rating of "Moderate" or higher in the zone(s) of concern.

The [Significant Fire Potential](#) is a 7-Day forecast product produced by the Southern Area Geographic Area Coordination Center (GACC) meteorologists. This product is comprehensive and has been updated to the latest NFDRS (version 4). Fire potential ratings utilize Energy Release Component (ERC-Y) values, 100-hour fuel moisture, and climatology of fire occurrence data from 2011-2020. The ratings are produced by GACC meteorologists Monday through Friday, with the exception of Federal Holidays, for each Predictive Service Area in Florida (map below) and are typically available by 3:30 PM Eastern Time.

Due to the multi-county area of each Predictive Service Area, NWS meteorologists will also analyze rainfall estimates, drought indices, and other available weather intelligence to influence Red Flag Warning decisions.

In the event of significant drought or extreme fuel dryness, it may become necessary to be more liberal with the criteria above for Red Flag Warning or Fire Weather Watch decisions. These instances will be in coordination and consultation with state and federal agencies who may request Red Flag Warning issuance despite forecast humidity and/or wind not reaching defined criterion.

Fire Weather Watch & Red Flag Warning Issuance

A Fire Weather Watch is issued when there is high confidence for a Red Flag event, usually within the next 18-96 hours. A Fire Weather Watch is not issued within the first 12 hrs of forecast issuance. Although it is desirable for a Fire Weather Watch to precede a Red Flag Warning, a watch is not prerequisite for a Red Flag Warning. A Fire Weather Watch will remain in effect until the forecast office determines that either the Red Flag event will not occur or that the Fire Weather Watch should be upgraded to a Red Flag Warning. A Red Flag warning will be in effect until the warning is canceled or expires.

When a Fire Weather Watch or Red Flag Warning is issued, the event shall be headlined in subsequent NWS fire weather forecasts for the impacted zone, including the Fire Weather Planning Forecast (FWF) and Spot Forecasts (FWS). Headlines are omitted however from the NFDRS forecasts (FWM).

The RFW and Fire Weather Forecasts (FWF) will be updated when a Fire Weather Watch or Red Flag Warning is issued or canceled, or if errors are discovered in the product text.

If unforeseen Red Flag conditions develop, a Red Flag Warning will be issued and an updated Fire Weather Planning Forecast (FWF) with the appropriate headline should be issued. Notify the impacted FFS, and affected federal agency dispatch offices impacted by the newly issued Red Flag Warning.

Fire Weather Watch & Red Flag Warning Content

The Fire Weather Watch and Red Flag Warning format will include segmented forecast information, and may contain an overview section, for each zone or zone combination expected to experience Red Flag conditions.

Overview: This section is optional. The overview will summarize the fire weather threat, onset time, reason for Red Flag issuance and area affected.

Discussion: A brief, non-technical discussion of the expected fire weather event.

Segmented Forecast Information: Each segment will include the UCG and geographic description of impacted zones and/or zone numbers, a headline describing the state of the Fire Weather Watch or Red Flag Warning (either that the product was issued, canceled, continued, upgraded), the effective time of the event, the critical weather elements expected and a description of the effective area. The order of the segments will be prioritized as watch/warning cancellation, current warnings then current watches. If multiple headlines are needed for one zone segment, the order of headlines will be 1) Watch/Warning Cancellations, 2) Current Warnings, 3) Current Watches.

Bullet Content: The content of the RFW product will contain bullet format forecast information. Content can include the affected areas, the timing of the weather impacts, weather element forecast including winds and relative humidity, and Significant Fire Potential Rating.

Fire Weather Watch Example

NOTE: "ERC" will be replaced with "Significant Fire Potential Rating"

URGENT - FIRE WEATHER MESSAGE

National Weather Service Tampa Bay Area - Ruskin FL

746 PM EST Wed Mar 7 2018

...FIRE WEATHER WATCH FOR LOW HUMIDITY...ROBUST WINDS...AND HIGH
ERC VALUES ON THURSDAY...

.Another very dry day is in store on Thursday with breezy
northwest winds expected. This combined with high ERC values and
low humidities will allow for enhanced fire danger across the
region tomorrow.

FLZ043-052-056-057-061-239-262-265-081300-

Sumter-Polk-Hardee-Highlands-DeSoto-Inland Levy-Inland Charlotte-
Inland Lee-

746 PM EST Wed Mar 7 2018

...FIRE WEATHER WATCH IN EFFECT FROM THURSDAY AFTERNOON THROUGH
THURSDAY EVENING FOR LOW HUMIDITY...ROBUST WINDS AND HIGH ERC
VALUES.

The National Weather Service in Tampa Bay Area - Ruskin FL has
issued a Fire Weather Watch, which is in effect from Thursday
afternoon through Thursday evening.

* AFFECTED AREA...Sumter...Polk...Hardee...Highlands...DeSoto...
Inland Levy...Inland Charlotte...Inland Lee.

* WIND...15 MPH with higher gusts.

* HUMIDITY...Minimum values of 25 to 35 percent.

* ERC...27 to 39

* IMPACTS...any fires that develop will likely spread rapidly.
Outdoor burning is not recommended.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

A Fire Weather Watch means that critical fire weather conditions
are forecast to occur. Listen for later forecasts and possible
Red Flag Warnings.

359 AM EST Thu Mar 8 2018

...RED FLAG WARNING FOR...GUSTY WINDS...AND HIGH ERC VALUES...AND CRITICALLY LOW HUMIDITIES THIS AFTERNOON...

.Another very dry day is in store today with breezy northwest winds expected. This combined with high ERC values and low humidities will allow for a few hours of critical fire danger for all inland areas of the Florida peninsula.

FLZ043-052-056-057-061-239-242-248-249-251-255-260-262-265-090000-
/O.CON.KTBW.FW.W.0005.180308T1600Z-180309T0000Z/

Inland Hernando-Inland Pasco-Inland Hillsborough-Inland Manatee-
Inland Sarasota-Inland Charlotte-Inland Lee-

359 AM EST Thu Mar 8 2018

...RED FLAG WARNING REMAINS IN EFFECT FROM 11 AM THIS MORNING TO 7 PM EST THIS EVENING...

* AFFECTED AREA...All inland areas of the Florida peninsula.

* WIND...15 MPH with higher gusts.

* HUMIDITY...Minimum values of 25 to 35 percent.

* ERC...30 to 39

* IMPACTS...any fires that develop will likely spread rapidly.
Outdoor burning is not recommended.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

A Red Flag Warning means that critical fire weather conditions are either occurring now...or will shortly. A combination of strong winds...low relative humidity...and warm temperatures can contribute to extreme fire behavior.

E. **On-Site NWS Support**

NWS Directive 10-402 <http://www.nws.noaa.gov/directives/sym/pd01004002curr.pdf>

A qualified NWS Incident Meteorologist (IMET) may be present at expanding or large wildland fire incidents. IMET deployments are dispatched through the NWS National Fire Weather Operations Coordinator (NFWOC) at the National Interagency Fire Center (NIFC) in Boise, ID. The IMET will work in support of the Fire Behavior Analyst, overall hazmat team and Incident Commander under the National Incident Command System Structure.

IMETs travel with an All-Hazards Meteorological Response System (AMRS) kit that can be used to gather weather intelligence to support the incident command team. Part of the AMRS kit includes a fire weather laptop computer which is a national resource to support deployed IMETs. IMET laptops have standardized software configuration that should not be modified. Laptops utilize a windows operating system. All IMETs are responsible for the care and transport of the laptops to and from incidents. While in possession of the laptop, the IMET meteorologist is also responsible for checking the laptop PC and restocking any support supplies, batteries, software, forms, etc. (to ensure dispatch readiness).

In Florida, NWS IMETs are located at NWS Jacksonville, NWS Tampa Bay-Ruskin and NWS Melbourne. An IMET Trainee is located at NWS Key West in 2023.

User agencies will reimburse the NWS for all costs associated with IMET mobilizations set forth in the latest [National Interagency Agreement](#) . Reimbursable expenses include overtime, per diem, travel, equipment maintenance, and transportation of the IMET and equipment.

Request an IMET

A request for an IMET meteorologist should be placed through the Staff Meteorologist at NIFC by calling (208) 334-9824. The requesting agency is responsible for coordinating transportation of the IMET to and from the incident site. Only a federal agency may order an IMET for on-site support. IMETs can also be ordered for prescribed burns for more complex operations as needed. Should the State of Florida, or a more local agency/county enter into an interagency agreement, the services would then be provided as per the agreements.

IMETs are responsible for obtaining the following information upon dispatch:

- Name of agency requesting support
- Name and telephone number of person requesting support
- Incident name and location
- Resource order for the IMET
- Directions to fire camp or incident location
- Type of incident team including the Incident Commander, Planning section chief and Fire Behavior Analyst, or Hazmat Lead if available.

IMET Onsite Needs

The user agency is responsible for providing adequate shelter for the IMET and the IMETs AMRS equipment to function efficiently. This includes a location free of excessive dust, heat and moisture, protection from wind and other elements, and a table and chair. The AMRS requires 120 volt AC power and the laptop needs quality Internet access. Charges to or from the incident should be charged to the incident.

Coordination on Incidents

The IMET and local NWS Weather Forecast Office (WFO) should coordinate at least on a daily basis. The local WFO will at least notify deployed IMETs of any significant weather threatening the fire site, including potential watches or warnings. If the IMET is located at an incident without phone communication, the WFO should notify the local dispatch office of potential critical weather conditions, and the dispatch office should then notify the incident and/or IMET.

In cases of watch or warning issuance by the local WFO, the IMET should defer to the local office. However, in the absence of a watch or warning from the local WFO, the IMET has discretion to issue a Fire Weather Watch or Red Flag Warning for the incident only. The IMET will coordinate with the local WFO, or in the absence of time, will notify the local WFO of any such issuance as soon as is practicable.

IMETs dispatched within a single WFO service area, the GACC Region and the NFWOC should coordinate and determine the necessity for regularly scheduled conference calls. If conference calls are considered necessary, the GACC Region should assist the WFO MIC in setting up the calls. The calls should include WFO forecasters, the deployed IMETs, and the NFWOC. Other nearby WFOs and any IMETs in that WFO's service area may also be included in the call.

IMET duties

IMET deployments to an incident can vary and can last up to two weeks, but will not exceed 14 days on site prior to mandatory rest day(s). The IMET serves within the incident management team, typically in concert with the Fire Behavior Analyst under the supervision of the Plans Section Chief. IMET duties include daily planning forecast coordination and composition, spot forecasts as requested, daily weather briefings, weather observations, weather records, daily log of duties and contacts, and ensuring the functionality of the AMRS equipment. The structure of each IMET forecast will vary depending on the weather needs of the incident management team.

F. Other NWS Forecast Services & Products

Other Special Support Services

NWS fire weather meteorologists are available to assist land management agencies teaching the weather units of fire training courses (S-190, S-290, RT-130, Florida Interagency Prescribed Burn course, etc.) Requests for assistance should be made through the local NWS fire weather program leader. Requests should be made as far in advance of the training dates as possible to allow for scheduling. Ancillary expenses incurred by the NWS while providing training should be reimbursed by the requesting agency.

Other meteorological services are available under the direction of the Interagency Agreement for Meteorological Services. These services include: observation training, site visits, course development work, training of weather observers and quality control of weather data.

Fire Weather Annual Report

Every WFO that issues non-routine fire weather products during their fire weather season (e.g., spot forecasts, Fire Weather Watches, Red Flag Warnings) will produce an annual report summarizing fire support in their area of responsibility. WFOs should disseminate the Annual Report to the same entities as the AOP. Annual Reports should summarize the calendar year activities. NWS Regional Headquarters will determine the due date of the Annual Report, and the regional statistics are due March 1st. For further guidance on annual fire activity reports from the NWS, please refer to [NWS Directive 10-404](#).

Conference Calls & Webinars

During periods of intense or prolonged wildfire activity, conference calls may be organized between land management agencies, state and federal emergency officials, state water management districts, and the National Weather Service. Topics of discussion include current drought and/or indices relating to drought, available surface and fuel moisture, wildfire activity, status of control operations, public and property safety issues, preparedness actions, and the outlook for future planning and logistics. Participating NWS offices may schedule routine web-based conferences with partners in their areas especially during occurrences of critical fire weather conditions

FARSITE Meteorological Data

Farsite is a fire behavior and growth simulator program used by Fire Behavior Analysts. FARSITE is designed for use by trained, professional wildland fire planners and managers familiar with fuels, weather, topography, and wildfire situations.

ASCII formatted files containing *daily* summaries of temperature, relative humidity and precipitation, and *hourly* data of wind speed, wind direction, and cloud cover are available from participating weather forecast offices. The weather files can be used with FARSITE to predict the likely behavior of a wildfire up to 72 hours into the future. Please contact your local WFO for more information about FARSITE.

Area Forecast Discussion

This is a NWS issued product where information on wildfire related weather effects may be included. Typically issued up to four times daily, the product serves as an excellent forum for coordinating meteorological reasoning among weather offices. Technical terms may be used, but the brief discussion should focus on weather effects and not fire behavior. As a coordination tool and ledger of ongoing NWS watch and warning issuance, use of the terms Red Flag Warning and Fire Weather Watch is permitted.

Dense Smoke Advisory (NPW)

This product is issued by local NWS offices for persisting local or widespread dense smoke reducing visibilities to ¼ mile or less over a portion or all of a forecast zone. Issuance of Dense Smoke advisories are typically pre-coordinated with authorities (DOF, FHP and/or other law enforcement authorities) who typically monitor the scope of smoke emissions in the area of existing fires.

NWS Hazardous Weather Outlooks (HWO)

The NWS Hazardous Weather Outlook (HWO) is a publicly disseminated discussion of any and all potentially hazardous weather that may affect a NWS forecast area out through 7 days. Not all Florida offices issue a HWO.

The HWO can contain weather information related to a fire/smoke threat to the public. The intent is two-fold: to provide the public with a sufficient level of awareness as to minimize the occurrence of accidental fire starts; and encourage a rapid and appropriate response should fire threaten life and/or property.

Web, Email Briefings, and NWS-Chat 2.0 (SLACK)

NWS offices used web-based and email-based briefings to alert partners of potential weather impacts over the next 7 days. Partners are urged to utilize NWS-Chat 2.0 (SLACK) to leverage decision-support services, ask questions, relay reports, and collaborate; Partners must register to use NWS-Chat 2.0 – <https://partnerservices.nws.noaa.gov/registration/>

Civil Emergency Messages (CEM)

Special messages that contain information on events that would require protective actions on the part of the public are transmitted by the NWS in conjunction with the Florida Division of Emergency Management and Department of Homeland Security via the Internet and broadcast on NOAA Weather Radio when requested by authorities.

Emergency situations requiring civil emergency messages may include wildfires threatening life and property, including the health hazard of excessive dense smoke. Such messages may include pending or ongoing evacuation orders.

Request and authentication of CEM messages come from the Florida Division of Emergency Management or law/fire enforcement officials. Text of the requested CEM should be

faxed or emailed to the appropriate NWS office with receipt confirmed to the sender. CEM messages should be same/tone alerted on NOAA weather radio.

Example of Civil Emergency Message (CEM)

BULLETIN-EAS ACTIVATION REQUESTED CIVIL EMERGENCY
MESSAGE NATIONAL WEATHER SERVICE TAMPA BAY AREA- RUSKIN FL
330 PM EST FRI MAR 19 2009

THE FOLLOWING MESSAGE IS BEING TRANSMITTED AT THE REQUEST OF THE LEE COUNTY EMERGENCY MANAGEMENT OFFICE.

A WILDFIRE AT LEHIGH ACRES COUNTRY CLUB HAS CONSUMED SEVERAL HUNDRED ACRES OF GRASS AND WAS SPREADING WEST TOWARD DENSELY POPULATED AREAS OF EAST LEHIGH ACRES. STRONG WINDS FROM THE EAST COUPLED WITH LOW HUMIDITY ARE EXPECTED TO PUSH WILDFIRES RAPIDLY WEST ACROSS LEHIGH ACRES OVER THE NEXT 3 HOURS.

EMERGENCY MANAGEMENT OFFICIALS HAVE ORDERED A MANDATORY EVACUATION, EFFECTIVE IMMEDIATELY, NORTH OF STATE ROAD 884 TO SOUTH OF 8TH AVENUE, AND WEST TO THE ORANGE RIVER CANAL.

LISTEN TO NOAA WEATHER RADIO, LOCAL TELEVISION, OR RADIO FOR ADDITIONAL INFORMATION ON THE LOCAL CIVIL EMERGENCY.

IV. Fire Agency Operational Support and Services

Florida Fire Weather Observations

Routine fire weather observations are meant to reflect the most volatile fire weather conditions of the day, so observations are taken during the mid-afternoon near the average time of maximum heating. Observations provide needed site weather information for forecast issuance and the verification of prior forecasts. Observations and forecasts provide needed weather input for land management decision making for operational planning, staffing, and the issuance of burn permits. To provide input for the preparation of afternoon planning forecasts, observations are taken daily at 2 pm eastern time (1pm central time).

Florida Forest Service (FFS) Observations

The deadline for FFS observations to be available is 2:30 pm eastern time. The majority of the observations are from Florida Forest Service district offices or using FAWN observations. Observations are accessible here: <http://fireweather.fdacs.gov/DistWxObs/>

The Florida Forest Service uses the Wildland Fire Danger Index (FDI) for estimating the potential for a fire to start and require suppression action on any given day. The FDI does not consider how quickly any fires that do start will grow due to prevailing winds.

For more information, refer to the following link: <http://fireweather.fdacs.gov/wx/fdi-report.html>

Relaying Potential Severe Weather Reports to NWS

The National Weather Service requests significant weather reports from land management agencies. The collection of timely, ground truth reports from reliable observers will always be of critical importance to the weather forecaster and can greatly aid NWS meteorologists in their warning decision making process. Delayed reports are also appreciated as they will be used to verify warning events. Reports can be made anytime directly to National Weather Service offices. When relaying a weather report to the NWS, give the location of the event, approximate time of damage (if known), extent of damage, and the agency reporting the event. Significant weather events to relay to the local NWS forecast office include:

- Funnel clouds or tornadoes touchdown and waterspouts
- Hail, especially when ½ inch or larger in diameter
- Measured wind gusts > 50 mph
- Uprooted trees, power lines down, structure damage from wind
- Any weather-related event with possible impact to life or property
- Rainfall accumulation of 2 inches per hour or 4 inches per day
- Weather that poses a potential threat to life and/or property

Federal Agency Forecasts

Scheduled forecasts are distributed to federal land management agencies through the internet and/or the Weather Information Management System (WIMS), with agency logon and password at: <https://famit.nwcg.gov/applications/WIMS>

Other Agency Forecasts

Forecast distribution is via the internet. One such internet address is through the Florida Forest Service at:

<https://www.fdacs.gov/Forest-Wildfire/Wildland-Fire/Fire-Weather/Current-Weather-Conditions>

A user agency alternate internet site for forecast access is available at address:

<http://weather.gov/fire>

Forecast Distribution Backup (Federal/State/Local U.S. Government Agency Users):

If WIMS and/or the Internet is down or inoperative, call your local NWS forecast office and have them email or fax the fire weather forecast. Users can also contact the internet address of each NWS homepage for local fire weather forecasts.

WIMS (NFDRS) Observations

NFDRS site forecasts must be entered into WIMS no later than 1455 local time. WIMS collectives of observations (NMCFWOXXX) are available between 300 pm and 400 pm daily. WIMS observations are collectively grouped into zones by forecast offices for calculation of zone site observation averages.

Observation sites are assigned a six-digit NWS station identification number. The first two digits indicate the state, the second two digits the county, and the last two digits are the consecutively assigned station numbers within a county. The local NWS office must be contacted for assignment of a six-digit number for any new permanent stations, or for changes in location made to existing stations already assigned a number. Several sites are also assigned a national environmental satellite (NESDIS) data platform ID's for automated interrogation.

DECODE FEDERAL WIMS/RAWS/NFDRS OBSERVATIONS:

- **ST NME** – STATION NAME
- **STAT'N** – 6-DIGIT NWS STATION IDENTIFICATION
- **DATE** - YYMMDD (YEAR, MONTH, DAY)
- **HR** - HOUR OF OBSERVATION
- **T** - OBSERVATION TYPE (**O**) (**F** FOR FORECAST COLLECTIVE) 📺
- **W** - STATE OF WEATHER AT OBSERVATION TIME:
 - 1 - CLEAR, LESS THAN 1/10 CLOUD COVER
 - 2 - SCATTERED CLOUDS, 1/10 - 5/10 CLOUD COVER
 - 3 - BROKEN CLOUDS, 6/10 - 9/10 CLOUD COVER
 - 4 - OVERCAST, MORE THAN 9/10 CLOUD COVER
 - 5 - FOG
 - 6 - DRIZZLE *
 - 7 - RAIN *
 - 8 - SNOW OR SLEET *
 - 9 – SHOWERS
 - 10 - THUNDERSTORMS
- *These entries, if entered as a forecast, will reset fire danger indices to zero.
- **DBT** - DRY BULB (AIR) TEMPERATURE
- **DPT** - DEW POINT TEMPERATURE
- **RH** - RELATIVE HUMIDITY
- **Y** – YESTERDAY'S LIGHTNING ACTIVITY LEVEL (LAL). (Midnight to Midnight)
- **M** - MORNING LIGHTNING ACTIVITY LEVEL. (Midnight to Observation time)
- **DIR** - WIND DIRECTION (from which the wind blows, reported in whole degrees)
- **WS** - WIND SPEED (10 Minute average)
- **10** - TEN HOUR TIME LAG FUEL MOISTURE
- **TMX** - MAXIMUM TEMPERATURE DURING LAST 24 HOURS (2PM-2PM).
Value cannot be less than DBT
- **TMN** - MINIMUM TEMPERATURE DURING LAST 24 HOURS (2PM-2PM).
Value cannot be more than DBT
- **HMX** - MAXIMUM RELATIVE HUMIDITY DURING LAST 24 HOURS (2PM-2PM)
- **HMN** - MINIMUM RELATIVE HUMIDITY DURING LAST 24 HOURS (2PM-2PM) 📺
- **PD** - PRECIPITATION DURATION (Enter total time in hours – cumulative number of minutes converted to hours-that precipitation occurred in the past 24 hours. If none, enter 0 (zero). A minus sign is used to indicate wet fuels at time of observation.
- **PPAMT** – PRECIPITATION AMOUNT (Total accumulation past 24 hours. If none, enter 0 (zero); If a trace, enter T. If at least T then duration must be at least 1).

Keetch-Byram Drought Index

The Keetch-Byram Drought Index (KBDI) evaluates the effects of long-term meteorological drought as it relates to the gain or loss from the duff layer down through an eight-inch depth of soil. Therefore, the index is based on the available moisture in the upper soil layers that can be used by vegetation for evapotranspiration.

The index measure is in hundredths of an inch of water, and has a range of zero through 800, with zero being saturated and 800 representing the worst drought condition. A KBDI of 250 means there is a deficit of 2.5 inches of groundwater available to vegetation. Subsequently as drought progresses, there is more available fuel that can contribute to fire intensity.

Evaluation of approximate index range values:

Zero to 200 -- soil moisture & large class fuel moisture are high and do not contribute much to fire intensity.

200 to 400 -- a near normal range but lower litter & duff layers are drying and beginning to contribute to fire intensity.

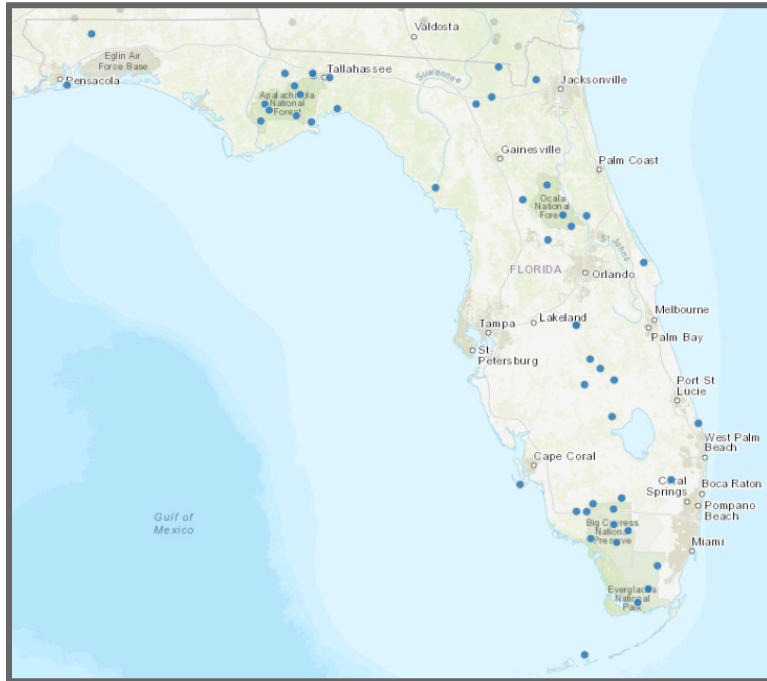

400 to 600 -- lower litter and duff layers activity contribute to fire intensity and will burn actively.

600 to 800 -- often associated with more severe drought with increased wildfire occurrence. Intense deep burning fires with significant downwind spotting can be expected. Live fuels can also be expected to burn actively at these levels.

Reference: Keetch, John J. And Byram, George M., *A Drought Index For Forest Fire Control*; U.S. Department of Agriculture, Forest Service, research paper SE-38, November 1968.
